

R Markdown: The Basics

Andrew Muehleisen

In this class, we will frequently use the 'R Markdown' file format.

For example, you will submit problem sets as .Rmd files.

```
# Header 1
```

This is an R Markdown document. Markdown is a simple formatting syntax for authoring webpages.

Use an asterisk mark to provide emphasis, such as **italics** or ****bold****.

Create lists with a dash:

- Item 1
- Item 2
- Item 3

```
...
```

Use back ticks to create a block of code

```
...
```

Embed LaTeX or MathML equations,
 $\frac{1}{n} \sum_{i=1}^n x_i$

Header 1

This is an R Markdown document. Markdown is a simple formatting syntax for authoring web pages.

Use an asterisk mark to provide emphasis, such as *italics* or **bold**.

Create lists with a dash:

- Item 1
- Item 2
- Item 3

Use back ticks to create a block of code

Embed LaTeX or MathML equations, $\frac{1}{n} \sum_{i=1}^n x_i$

What is Markdown?

Markdown is a simple language for converting plain text into formatted, rich text (as in a Word document).

Why are we using R Markdown?

In a single document, R Markdown lets us have both...

1. **Formatted**, *stylized* text
2. Embedded R code that runs and renders with the document

```
print("R Markdown is awesome!")
```

Example:

```
1 ▾ ---
2 title: "Problem Set 2"
3 output:
4   html_document: default
5   html_notebook: default
6   pdf_document: default
7   word_document: default
8 ▲ ---
9
10 ▾ ### Name:
11
12 About this format: This problem set is saved as an [R
13 Markdown](http://rmarkdown.rstudio.com) Notebook. When you execute code
14 within the notebook, the results appear beneath the code. When you save
15 the notebook, an HTML file containing the code and output will be saved
16 alongside it (click the *Preview* button or press *Cmd+Shift+K* to
17 preview the HTML file). To add a new R chunk click the *Insert Chunk*
18 button on the toolbar or by pressing *Cmd+Option+I*.
19
20 **To submit: Please rename this file LASTNAME_ProblemSet2 and upload
21 both the .Rmd and the final .html file to the assignments folder on
22 Canvas**

41 CO2data <- fread('ftp://aftp.cmdl.noaa.gov/products/trends/co2/co2_mm_m
42 lo.txt', skip = 71)
43
44 # give descriptive but short names
45 names(CO2data) <- c("year", "month", "decimalDate", "averageCO2",
46 "interpolatedCO2", "trendCO2", "numberDays")
47
48 ```
```

Getting started

For all problem sets, we have provided the initial Markdown scaffolding.

You will:

1. Open problem sets in R Studio
2. Fill in the necessary text or code
3. Create the associated HTML document, and submit both documents on Canvas

Getting started: Headers

To format text in a markdown document, we use symbols alongside the text.

For example, we use **#** to indicate a header. Multiple **#**s can be used to create a hierarchy of headers.

```
# This is a top-level header  
Some text  
  
## This is a sub-header  
Some more text  
  
### This is a lower-level header  
An example
```

This is a top-level header
Some text

This is a sub-header
Some more text

This is a lower-level header
An example

Getting started: Emphasis

To create emphases in text, like bold or italics, we surround our text with asterisks `'*'`

Italics = `*text*`

Bold text = `**text**`

```
I really want to emphasize this word.  
Perhaps I want to emphasize this word in bold.  
Why not emphasize our word using both?
```

I really want to emphasize this *word*.

Perhaps I want to emphasize this **word** in bold.

Why not emphasize our ***word*** using both?

Getting started: Lists

Lists are very easy. Just use numbers or dashes.

```
1. The first entry  
2. The second entry  
3. The final entry
```

```
- Point 1  
- Point 2  
- Point 3  
|
```

```
1. The first entry  
2. The second entry  
3. The final entry
```

```
• Point 1  
• Point 2  
• Point 3
```

Getting started: Code Chunks

Finally, using R Markdown, we can embed code into the resulting document. We do so by delineating chunks of code with backticks.

Type, or use R Studio

```
## Embedded code

Using three backticks, we can run code:
```

```
```${r}
data(cars)
summary(cars)
```
```

Embedded code

Using three backticks, we can run code:

```
data(cars)
summary(cars)
```

| ## | speed | dist |
|----|--------------|----------------|
| ## | Min. : 4.0 | Min. : 2.00 |
| ## | 1st Qu.:12.0 | 1st Qu.: 26.00 |
| ## | Median :15.0 | Median : 36.00 |
| ## | Mean :15.4 | Mean : 42.98 |
| ## | 3rd Qu.:19.0 | 3rd Qu.: 56.00 |
| ## | Max. :25.0 | Max. :120.00 |

Getting started: Code Chunks

Note that at the beginning of the code chunk, we specify 'r' to indicate that the code will be an R expression. We can also add helpful options here.

“**echo = FALSE**”: hide code, just show output

Embedded code

Using three backticks, we can run code:

```
## Embedded code
```

```
Using three backticks, we can run code:
```

```
```{r, echo = FALSE}  
data(cars)
summary(cars)
```
```

| ## | speed | dist |
|----|--------------|----------------|
| ## | Min. : 4.0 | Min. : 2.00 |
| ## | 1st Qu.:12.0 | 1st Qu.: 26.00 |
| ## | Median :15.0 | Median : 36.00 |
| ## | Mean :15.4 | Mean : 42.98 |
| ## | 3rd Qu.:19.0 | 3rd Qu.: 56.00 |
| ## | Max. :25.0 | Max. :120.00 |

Getting started: Code Chunks

Note that at the beginning of the code chunk, we specify 'r' to indicate that the code will be an R expression. We can also add helpful options here.

“results = ‘hide’”: show code, but not output

```
## Embedded code

Using three backticks, we can run code:

```${r, results = 'hide'}
data(cars)
summary(cars)
```
```

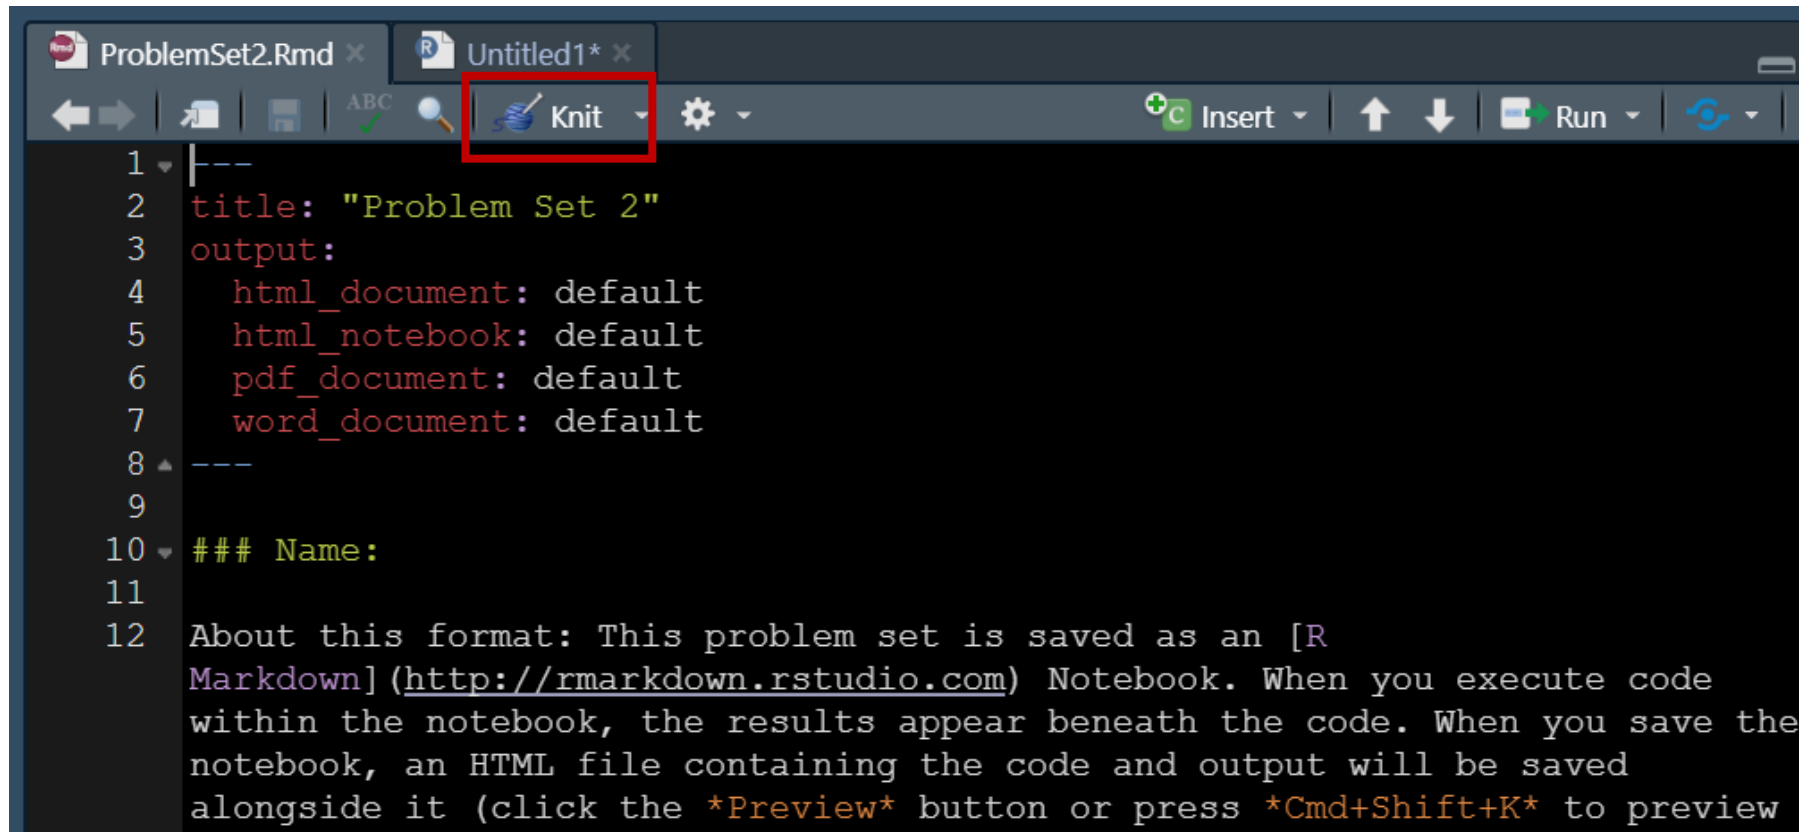

Embedded code

Using three backticks, we can run code:

```
data(cars)
summary(cars)
```

Getting started: knitr

Finally, we generate the HTML document output by clicking on the 'knit' button in our script editor.

A screenshot of the RStudio interface. The top toolbar shows the 'Knit' button, which is highlighted with a red rectangle. The button has a blue icon of a document with a pencil and the word 'Knit' next to it. To the right of the 'Knit' button are icons for 'Insert', 'Run', and a refresh icon. The main editor window shows a script with R Markdown syntax. The script starts with a title 'Problem Set 2' and lists output formats: html_document, html_notebook, pdf_document, and word_document, all set to 'default'. It then has a section header '### Name:' followed by a paragraph of text explaining the format and how to preview it.

```
1 |---  
2 title: "Problem Set 2"  
3 output:  
4   html_document: default  
5   html_notebook: default  
6   pdf_document: default  
7   word_document: default  
8 |---  
9
